1 Depth-one spender its owners receive no allowances

$\delta(v) = \Sigma_u P_{uv} = 1 + ⅓ \qquad r_v = c\,(1 + d\,\delta(v))$

EndorseRank: P_{uv} = $w(u,v)$ / $o(u)$, an owner's endorsement divided over its spenders

2 Deeper spender

Its owner u_3 receives an allowance, so u_3 does not score c and the score of x departs from the closed form: propagation over more than one step.

allowance edge, labelled with its transition probability P_{uv} (example weights) (c) score of a node without in-edges
