1 A crawl on the contract graph

visited frontier not yet discovered

Seed: one of 20 contracts of the giant strongly connected component.

A visit reveals the out-edges (`out` mode) or the out- and in-edges (`both` mode, primary).

After K visits the frontier is scored on the part read so far ('), and the top max(1, $\lfloor \rho K \rfloor$) are visited next.

2 Orderings compared

order of discovery

BFS **random**

visited contracts with an edge to it

IB′$_A$ **IB′$_T$** **IB′$_U$** backlinks

walks on the graph seen so far

C-PR′ $\lambda = 0.5$

0.25, 0.75, its two layers **S-PR′**

EndorseRank′

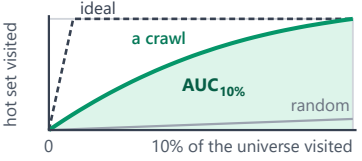

EndorseRank-activity′ **AWP′**

references, not crawls

ideal order; C-PR and union in-degree of the full graph

3 How soon hot contracts are found

Importance from user accounts, which no ordering reads: I_T (dollars sent) and I_A (capped allowances). Hot set $H_q(I)$: the top q = 1% of the universe.

Decision at T_{obs}, primary mode, on $H_q(I_T)$ and $H_q(I_A)$:

D_1 = AUC$_{10\%}$(C-PR′) − AUC$_{10\%}$(BFS)

D_2 = AUC$_{10\%}$(C-PR′) − AUC$_{10\%}$(IB′$_U$)
