1 Two rankings toy values

2 The six pairs

P, Q	concordant	**P, R**	concordant
P, S	concordant	**Q, S**	concordant
Q, R	discordant	**R, S**	tied in the score

A pair tied in either ranking is neither concordant nor discordant.

3 Kendall's τ_b

pairs	$n_0 = 6$
concordant, discordant	$n_c = \mathbf{4}$, $n_d = \mathbf{1}$
tied pairs per ranking	$n_1 = \mathbf{1}$, $n_2 = 0$

$$\tau_b = \frac{\mathbf{4} - \mathbf{1}}{\sqrt{(6 - \mathbf{1})(6 - 0)}} \approx \mathbf{0.55}$$

without the tie corrections, $\tau_a = (4 - 1)/6 = 0.50$
