WHO FACES THE CHOICE	SIGNAL THAT SUITS IT	STATED LIMITS
Wallet interfaces and security tooling	**In-approve degree** **EndorseRank** the contracts with a balance that authorize a spender, each allowance counted up to the balance behind it	The position of a graph node, not a security audit or a guarantee; empty for most spenders.
Block explorers, auditors and integrators	**Contract backlink count** an order of work with no solver; in the deciding run sooner than C-PR′	A first filter at best; says nothing about the quality of a contract's code.
Flow monitoring	**Transfer in-degree** **AWP** current flow read from in-degree and in-value directly	AWP has the best record of the walks, but little is lost by counting.
Lending protocols	A ranking of the contracts that users rely on, as one later input to credit decisions about contracts.	**Not tested:** no score was compared with a default, repayment or loss outcome.

Keep the signals apart: allowances where authorization matters, transfers where flow matters. Folding both edge types into one walk was not worth it against AWP on these data, and rule B is not met.
